Q: How to create a vector of derived class at runtime? Let's say I have a class Animal that can have a cat or a dog. I then have a class Cat and a class Dog. Each class has its own accessor methods. class Cat { int legs; }; class Dog { int legs; }; Then I want to create a vector that contains dogs and cats. vector animals; This is

easy, but the catch is that I want to create the vector at runtime, depending on the condition at runtime. Given an animal, say, a dog, it should be possible to get the object Cat. Is there a way to do this in C++? If not, can you give me pointers in the direction of such an algorithm in C++? A: It is possible if you have a virtual destructor: struct Animal { virtual ~Animal()

```
{ } int legs; }; struct Cat :
Animal { Cat(int legs) :
legs(legs) { } }; struct Dog
: Animal { Dog(int legs) :
legs(legs) { } }; class
AnimalFactory { public:
virtual ~AnimalFactory()
{ } virtual Animal* create()
= 0; }; class CatFactory {
public: virtual
~CatFactory() { } virtual
Cat* create() = 0; }; class
DogFactory { public:
virtual ~DogFactory() { }
virtual Dog* create() = 0;
```

```
}; class MyAnimal : public
Animal { private:
std::unique_ptr factory;
public:
MyAnimal(std::unique_ptr
factory) :
factory(std::move(factory))
{} MyAnimal(const
MyAnimal& other) =
delete;
MyAnimal(MyAnimal&&
other) = delete; Animal*
create() override { return
factory->create(); } const
Animal* create() const
```

override {

Saffron Gate is a sweeping, epic album that stands up to the most timeless of progressive rock - plus it features some clever, modern twists on classic jazz (check out the title track). With Levi Seacer, Jr., as a "modern day Charles Mingus" on trumpet and vocals, as well as a touring keyboardist on the road, Saffron Gate
